

ENVIRONMENTAL MANAGEMENT, SUSTAINABILITY AND PLANNING APPROVALS

At WolfPeak we pride ourselves on our strong site environmental management background. All our team have worked in site-based roles and understand the challenges of delivering major infrastructure projects in tight timeframes and sensitive locations.

We bring this experience to every project we work on. We know how things get built and so can add real value within the project team to ensure the most practical and optimal environmental and sustainability outcomes are achieved.

Key services we offer in this area include:

- Developing environmental planning approval documents including Environmental Impact Statements and Review of Environmental Factors. Our knowledge of how things get built means when we complete an assessment we can recommend mitigation measures that will work and get implemented. We are currently TransGrid's number 1 rated environmental approvals consultant.
- Planning approval resources. Our team are available for secondment into project teams to deliver and manage planning approvals. We currently have people undertaking these roles for Transport for NSW as well as ARTC on the Inland Rail program.
- Developing Construction Environmental Management Plans and sub-plans for projects. Our extensive onsite experience means we develop plans that are practical and smart and can be implemented. We also review Construction Environmental Management Plans and sub-plans on behalf of the Department of Environment and Planning so we know what they require to approve a plan quickly and also what a sector leading plan looks like.
- Site environmental resources. Our team are available for secondment onsite to augment or support your site environment team. Our site experience means all our people can immediately add value. We currently have team members working on Sydney Light Rail, Northern Beaches Hospital Roads Project, Pacific Highway Complete Project and North West Rail Link.
- Sustainability resources. Our team are available for secondment as the sustainability resource within a project team and can also develop sustainability plans. Sustainability team members have full ISCA training and onsite experience in delivering sustainability.
